

Bayerische Spielbanken, Munich

«The high requirements of the Bavarian casinos could be realized as standard features in close collaboration with the directors. The newly created transparency in the access control area meant that a rapid acceptance was achieved among all employees.»

Walter Nidermayer

Complete solution for six Bavarian casinos

At the threshold to a new millennium, the State Lottery Administration / Casinos department wanted to implement a standardized access control and time & attendance system in the course of the planning for five new casinos. The central management meant that a SAP R/3 system could be introduced across the board for all casinos. In 1998, comprehensive performance criteria were defined for the new system by Bayerische Spielbanken.

The requirements included a touch-free chip card technology, certified interfaces to the SAP software, the option of integrating canteen solutions and the combination with a money card. The system was to be a company-wide solution for access control, door management and time management. It was also to assume the monitoring and control functions of various building facilities such as e.g. the lift control, burglar alarm or also the mechanical locking system.

During the call for tender for the new building of the casinos in Bad Füssing, Kötzing, Feuchtwangen, Lindau and Bad Steben, Kaba Benzing VAR Bavaria Zeitsysteme GmbH, headquartered in

Munich, was awarded the contract to implement the project.

Central elements of this solution are the touch-free readable and writable LEGIC chip in the employee key tags and employee keys, various scanning devices from Kaba Benzing and as the centerpiece of the system the certified interface B-COMM for R/3 ERP to the SAP module HR which covers the entire area of personnel management. A focus was placed on future-oriented developments in the terminals for time & attendance. This involves a terminal of the latest generation which is based on the innovative JAVA technology. The Bedanet 93 80 terminal with a graphical display is operated via a touchscreen and connected via the Intranet, Internet or Extranet to the network.

For personnel time & attendance and SFDC complete solutions in the SAP environment, Kaba Benzing VAR Bavaria Zeitsysteme GmbH also offers customized project services in addition to the communication software B-COMM for R/3 ERP and the Kaba Benzing terminals. These include the analysis and planning, specification, implementation, system integration, installation, commissioning, training and service/support/hotline.
